Badger Barrier Gateway Kit Setup Instructions

Your Badger Barrier Gateway Kit includes the following items:

- 2x 1.2m x 50mm Wooden Posts.
- 1x 100m of Polycord.
- 20x 90cm Green Plastic Posts.
- 8x Gate Anchor Insulators.
- 20x Cord Joiners.

1. This kit is designed to add an access point to a Badger Barrier fence. It can be added to an end of a fence or at a mid point.
2. Switch your fence energiser off before starting work on the fence.
3. Drive the two wooden posts into the ground each side of where you wish the gateway to be, so that enough length of the existing fence cord is left to reach beyond the wooden posts.
4. Screw the eight double-loop anchor insulators into the two wooden posts at the level of your fence lines.
5. Use the cord provided, the cord joiners and the gate handles to create the horizontal gateway lines. The gate handles have an integral spring so that the gateway lines can be closed and still maintain horizontal tension, use the cord joiners to adjust the line lengths appropriately. Use the same cord joiners at the 'hinge' side to create cord connections between the horizontals (a).
6. Now connect the existing fence lines to the double-loop anchors using more of the cord joiners, from both sides if your gateway is midpoint or from one side if at the end. Remember to keep all the horizontal lines of your fence and gate adequately taught so as not to sag and prevent vegetation from making contact with the fence.
7. Once you have switched your fence energiser back on use a fence tester to make sure that all parts of your fence and gate have a live pulse.

Note: If using with a short post Badger Barrier fence then the wooden posts can be trimmed accordingly.
