Premium Bowling Green Extra Gate Kit
208125

Setup Instructions

Your Premium Bowling Green Gate Kit includes the following items:-

250m of polycord
2x Wooden Gate Posts
8x Double loop anchor insulators
4x Gate Handles

If your mains socket is further than 50m from your fence then you will need to use a longer lead out cable. To order an additional 100m length order part number 5304448.

You may wish to control your energiser using a mains timer please order part no. ES0035.

1.   Ensure your energiser is switched off whilst working on your fence.
2.   Decide where the position of your additional entrance will be. Drive your two wooden gate posts into the ground either side of your entrance to create a gateway.
3.   Insert four of the double loop anchor insulators into each of the two wooden gate posts to coincide with the positions on the plastic posts. If your are creating an additional Gate Entrance after your fence has been erected you will have to cut each horizontal polycord line and tie to the double loop anchor on each gate post.
4.   Your kit is supplied with four Gate Handles, these are used to create four horizontal opening lines across the Entry Gate. Take a length of Polycord and cut it equal to the distance between the Gate Posts, cut four pieces to this length. Tie one end of each line to the loop anchor on one Gate Post and the other end to the spring on the Gate Handle making sure the overall length allows for slight tension on the spring after the Handle is hooked into the Double Loop Anchor. Repeat this for the other three lines.
5.   Your fence is now ready to plug in and switch on.

Please see from the diagram below how your additional Entrance Gate is to be created.

For instruction purposes posts are shown closer together than is necessary. In practice, posts can be placed about 4 metres apart.

4x wooden corner posts.

Fixed wooden 'gate posts'

90cm Plastic Posts

Polycord

Use the four lowest conductor supports for badgers. The higher positions may be required for foxes. All fence lines must be connected together.

Join lines together using polycord & connectors

Energiser to Fence lead

Energiser should be kept within a building.

Keep weeds and grass from touching any of the fence lines.

Push ground rod into damp soil and attached the earth lead to it.

Energiser to Ground lead.

Drive the wooden posts into the ground to leave approx. the same height above ground as the green plastic posts.

To create an additional entrance please order Gate Kit 208125
